1-

1- mention its name?

2- mention 4 usages?

answers

1- Cusco's speculum

2- used in

- a) Take vaginal swap
- b) examination of vaginal wall
- C) insertion of IUD
- d) taking cerviact smear for detection of malignants.

Posted Image

2-

1- what's the diagnosis? the name of this investigation?

2- Mention 4 symptoms in this case?

3- Mention Types of TTT?

Answers

1- S.M Fibroid - saline sono-hysterography.

2- symptoms:-

- A) Menorrhagea or metrorrhagea.
- B) Pain.
- C) Frequent micturition >> due to pressure on U.Bladder
- D) RPL

3- TTT

- A) Medical >> NSAIDs, Prggestin
- B) Surgical >>> myomectomy or hysterectomy

Posted Image

3-

1- cause of L.H surge?

2- mention methods of detection of ovulation?

Answers:-

1- +ve feedback of E2 & Progesterone released from luteinizing granulosa cells.

2-

- a) BBT
- b) Folliculometry
- c) Mid-luteal progesterone level.
- d) Urinary LH Kits.
- e) premenstrual endometrial biopsy.

1.What is this instrument ?

2.What are its uses ?

3.Why it has 2 ends with 2 different sizes?

4.What is the the indication of being grooved ?

5.Name the position of application and mention the benefits of this position.

Answers :

1.Sims speculum (retractor)

2.-For visualization of anterior vaginal wall for diagnosis of vesico-vaginal fistula

-Used as posterior vaginal wall retractor

-Used during surgical repair of fistula

3.To be used according to the capacity of the vagina

"The small end for small vaginae

& the large one for large vaginae"

4.For drainage of any discharge or urine

& to allow air entry.

5.Sims position : for upward displacement of intestine creating -ve pressure intraabdominally causing vaginal insufflation and hence better exposure

1. Identify this instrument .

2. Why it is serrated and what is the indication of its lock ?

3. Mention its uses .

Answers

1. Ring forceps.

2. It is serrated to allow a good grasp and its lock to allow fixation in its site .

3. It is used to grasp the pregnant cervix and apply traction on it in operations as:

-Vaginal evacuation

-Cerclage operation

-Repair of cervical laceration " two ring forceps are used to (walk around) the cervix to determine the site of laceration and to visualize it apex "

It is also used to grasp infundibulopelvic ligament during myomectomy.

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

1. Identify these devices.
2. What are the modes of action ?
3. What are the advantages of their use ?
4. What are their contraindications ?
5. Enumerate their complications

Answers:

1. Different types of IUDs.

2.- Local foreign body inflammatory responses

- Interfere with sperm motility
- Interfere with implantation (via increased local PG production)
- Copper : Inhibits carbonic anhydrase and alkaline phosphatase activity & exerts a toxic effect on sperms inhibiting its motility
- Progesterone : induces atrophic endometrial changes

3.- Single choice method with a long term protection (6-8 years)

- Available
- Reliable , with very low failure rate
- Doesn't affect lactation ,future fertility ,sexual intercourse

4.- Pregnancy

- Uterine anomalies or Uterine cavity pathology
 - Undiagnosed vaginal bleeding
 - History of ectopic pregnancy
- History of Pelvic inflammatory diseases

5.-Vaginal bleeding

- pelvic infection
- Pelvic pain
- perforation
- Expulsion
- Pregnancy on IUD

" N.B. : IUD prevents Intrauterine but not extrauterine pregnancy "

1. Identify this .

2. What is the value of the test shown?

3. What is the cause of the ulcers?

4. What are urinary complications in this case?

Answers:

1. Uterine prolapse (may be 3rd degree)

2. Used to differentiate between 2nd and 3rd degrees of prolapse

" If the 2 fingers can be approximated together above the uterine fundus then the whole uterus is completely protrudes outside the introitus diagnosing complete procidentia "

3. As a result of congestion and circulatory changes rather than friction with thighs
(Decubitus ulcer) .

4. In uterine prolapse, the lower ends of the ureters become constricted in the ureteric canals at the sides of the uterus

- Frequency of micturation

- Stress urinary incontinence

- Inability to complete micturation unless the ant. vaginal wall is reduced upwards and supported by the patient fingers .

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

1.What is the procedure?

2.What is its value?

3.What are the abnormal findings and management ?

Answers:

1.Pap smear

" In the top photo, you can see the metal speculum used to open this woman's vagina and the wooden Aylesbury spatula used to collect a sample of the cells from the endocervix. The spatula gently scrapes the area around the os in a circular motion to gather cells.

The bottom photo is of an endocervical brush being swiped in the os of the cervix. The cells gathered on the brush and spatula will be wiped/smeared on a glass slide and examined in a laboratory or under a microscope to look for abnormalities".

2.Early detection of cancer cervix " Regular screening for the asymptomatic high risk patients , with colposcopy and colposcopic directed biopsies performed to cases with abnormal Pap smears"

3.Low grade lesions :

- conservative :anti-inflammatory and follow-up
- Ablation therapy

High grade lesions :

- Conization and follow up in young
- LEEP
- Hystrectomy in old patients

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

1.What is this procedure ?

2.What `re its types?

3.What is the timing of this procedure ?

4.What`re the advantages of this procedure?

5.What`re the complications of this procedure?

Answers:

1.Episiotomy .

2.Median & Mediolateral .

3.-When the head is visible during a contraction to a diameter of 3-4 cm " just before crowning "

-Before traction by forceps of vaccum extractor .

- Too early episiotomy >> causes bleeding from the gaping to be considered .

- Too late episiotomy >> is useless.

4.-Clean cut incision which is easy to repair compared to irregular vaginal lacerations .

-Shorter 2nd stage of labour .

-Reduce intracranial hge in preterm labour by reducing compression-decompression effect .

-Reduce damage to maternal pelvic floor .

5.-Increased blood loss

-Extension to anal sphincter (median type) or ischio-rectal fossa (mediolateral type)

-Haematoma formation

-Infection

-Perineal pain , dyspareunia and ugly scar .

Mediolateral type

Median type

1.What is that organism?

2.What is the mode of transmission ?

3.What are the symptoms of the disease it causes ?

4.What is the treatment?

Answers:

1.Trichomonas Vaginalis

" an ovoid , motile & flagellated protozoon "
causes Trichomonas vaginalis vaginitis .

2.(70%) of cases are sexually transmitted

3.- 25-50% are asymptomatic

- Vaginal discharge " copious , yellow or green , frothy & offensive "

- Pruritus" vulval irritation "

-Dysparunia

4.Metronidazole ,Tinedazole or Clotrimazole

-The husband should be treated at the same time

- Recurrent and resistant infection necessitate screening for STDs

1-name the technique.

2- mention indications

3- mention possible complications

1- Intracavitary Radiotherapy.

2-

Endometrial carcinoma

Cervical Carcinoma

3-

Vaginal fibrosis & stenosis

Radiation induced menopause

1. Identify this surgical procedure .
2. Mention its contraindications .
3. What are its complications ?

Answers:

1. Abdominal myomectomy .

2. During pregnancy >> intractable bleeding due to increased vascularity with high risk for abortion
(except in acute emergencies >> e.g. torsion in a pedunculated SSM)
- After menopause
- Suspicion of sarcomatous changes.
- Multiple large myomata

3. (Immediate complications)
- Excessive blood loss during operation
- Increased incidence of postoperative low grade fever , anemia , pain and ileus
(Delayed complications)
- Persistent symptoms
- Recurrence
- Postoperative pelvic & peritubal adhesions
- Rupture uterine scar during labor or rarely during pregnancy

Myomectomy in steps :

Here is the abdomen before surgery. The uterus is the size of a 5 month pregnancy. It can be seen to protrude up to the belly button.

The uterus, which, is greatly enlarged by the fibroid, is lifted through the incision. A laser is being used to make an incision into the uterus so the fibroid can be removed.

The fibroid is being separated from the wall of the uterus (*myometrium*). It is very important to do this in the exact location between the fibroid and the myometrium in order to prevent excess bleeding.

This shows the fibroid almost completely free from the uterus. It is attached only at the base. The blood vessels at the base are being sealed with an electrosurgical device.

The uterus is being reconstructed by suturing the walls together with dissolving suture. This is being done in multiple layers to ensure a precise repair.

The last layer of sutures is placed, and the uterus is completely restored. A barrier to prevent adhesions will be placed before the uterus is replaced into the abdomen and the abdomen closed.

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ " (يوسف: الآية 90)

The patient complained of Galactorrhea , infrequent periods and infertility .

- 1.Which hormone assay would help in making a diagnosis ?
- 2.If the hormone level was elevated , what other investigations should be done ?
- 3.If an abnormality was found , what medical treatment might be indicated ?
4. If an abnormality was found , what surgical treatment is occasionally required ?

Answers:

1.Serum prolactin

(normal level in non pregnant females is 2.9-29 ng/ml)

- "but normal value ranges may vary slightly among different laboratories"
 - " elevation would indicate a possible pituitary tumor " macroadenoma"
- (Patients with pituitary tumours have very high levels , typically more than 100 ng/ml) "

2.An X-ray of the pituitary fossa and possibly Ct scan and MRI .

3.- Bromocriptine (Parlodel)

- Lisuride hydrogen maleate
- Cabergoline

4.Removal or ablation of pituitary tumor

" Trans-sphenoidal surgery or Gamma- knife techniques are reserved to cases with failure of response to medical treatment , or larger tumors with CNS pressure symptoms ".

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

- 1.What name is given to a cervix with this appearance ?
- 2.What infective organism is usually responsible ?
- 3.What are the morphological features of the responsible organism ?
- 4.What is the treatment of choice ?

Answers:

1.Strawberry cervix .

2.Trichomonas vaginalis .

3.A unicellular organism with four flagellae and an undulating membrane .

4.Metronidazole " the patient partner should be treated also ".

Another slides

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

- 1.What`s your diagnosis ?
- 2.What are the investigations that should be done ?
- 3.What`s the treatment ?

Answers:

1.Hirsutism " Excessive growth of androgen dependent sexual hair "

2. Hormonal assay :

- **Plasma testosterone level (normal = 0.2-0.8 ng/ml)**
- **Free testosterone level (normal = 1-3 % of total testosterone)**
- **DHEAS (normal = 1500-2500 ng/ml)**

Radiological investigations :

- CT or MRI on pitutary gland**
- IVP and abdominal US for adrenal tumor**
- Pelvic US for PCO and virilizing tumors .**

3.-Elimination of specific causes

- Hair removal techniques**
- Suppression of androgen synthesis**

" OCPs , corticosteroids , Spironolactone , Cyproterone acetate "

-Androgen receptor blocker

" Cimitidine "

A 18 years old female complaining of 2ry amenorrhea and develops severe loss of weight

1.What is the most likely diagnosis?

2.What is the cause of amenorrhea in this case?

3.what are the investigations to be done in a case with 2ry amenorrhea ?

Answers:

1.Anorexia nervosa

" a psychological eating disorder characterized by an obsessive fear of gaining weight "

2.Functional hypothalamic hypogondism

" Rapid weight loss below 20% of the ideal body weight "

3.- Hormonal assay

" B- hCG, PL, Thyroid function tests , Pitutary gonadotrophines , Serum E2 , progesterone & androgen "

- Pelvic US

- Karyotyping

- Autoimmune screen

- CT/MRI scanning

" إِنَّهُ مَنْ يَتَّقِ وَيَصْبِرْ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

1. What is this procedure ?
2. Mention its indications .
3. Mention its complications.

Answers:

1.IVF

- 2. - Female factor "** Severe tubal damage , Extensive tubo-peritoneal adhesions & Failed tuboplasty procedures "
- Mild Male factor
 - Unexplained infertility

- 3.- Allergic reactions to ovulation induction agents**
- OHSS "Ovarian hyperstimulation syndrome" with its complications
 - Trauma due to oocyte retrieval.
 - Pelvic infections
 - Complication of ART pregnancies

1. Identify this swelling .
2. What is the pathology of this swelling .
3. What are the complications ?
4. What is the most common treatment ?

Answer:

- 1. Bartholin's duct cyst >> if infected : Bartholin's abscess.**
" N.B. : It is actually a cyst of the duct and not of the gland "

2. It is caused by obstruction of the duct of Bartholin's gland leading to accumulation of mucoid secretions " it is lined by transitional epithelium ".

3. Secondary infection leading to a painful Bartholin's abscess , which is tender, tense ,surrounded by vulvar redness , swelling and edema .

4. Marsupialization to create a new opening between the duct wall and the skin .

A thorough bimanual examination should be performed to determine the extent of the abscess.

The labia are retracted with interrupted 3-0 sutures, and the introitus of the vagina is exposed. An incision is made over the mucosa of the vagina at its junction with the introitus down to the wall of the gland.

The wall of the gland is incised. The entire length of the superficial incision is shown.

The contents of the abscess are evacuated.

A culture is taken of the abscess. The walls of the abscess are grasped with Allis clamps.

The wall of the abscess is sutured with interrupted 3-0 synthetic absorbable suture to the skin of the introitus laterally and to the vaginal mucosa medially.

The marsupialization is complete. Generally, no packing or drain is necessary. The patient is placed on a regimen of hot sitz baths on the second postoperative day. A laxative and stool softener are given on the third postoperative day. Antibiotic therapy should be directed by the results of the culture. Sexual intercourse can usually be resumed in 4 weeks.

" إِنَّهُ مِنْ يَشَقُّ وَيَصْبِرُ فَإِنَّ اللَّهَ لَا يُضِيعُ أَجْرَ الْمُحْسِنِينَ "

cog05001 www.fotosearch.com

1. Identify this procedure .

2. What is its use ?

Answers:

1. McDonald's cerclage.

2. It is the most successful treatment of cervical incompetence (incompetent isthmus) during pregnancy .

- **Timing of procedure** >> at 12-14 weeks to exclude 1st trimesteric spontaneous abortions associated with fetal chromosomal abnormalities .

- **The suture is removed** >> at 37 weeks or at onset of labour pains at any gestational age

Shirodkar versus McDonald's Cerclage
